Torre Seta

Milan, Italy

PROJECT
Architecture, facade
DATE
2022 - on going

A diversified ar The architectural project for **the renovation of the facade of Seta Tower** for the partial restoration of the architecture of the pre-existing tower, giving it a distinctive morphology that stems from the cues from the previous structure and translates into a modern architectural solution.
The design concept provides for loggias that, enveloping the entire building, establish a **connection with the surrounding area** and offer usable and scenic outdoor spaces: a soft aesthetic with sinuous shapes that, like light and elegant ribbons, enfold the building.
The building has two floors below ground and 19 above, with a total height of approximately 70m.
Starting from the lower floors, the **dynamic elegance** of the parapets extends fluidly over the entire height of the tower, softening its overall profile.
A special glass insert, a stylistic element that is a feature of buildings designed by the Studio, has been inserted in an irregular pattern in each parapet enabling residents to enjoy captivating views of the city of Milan.
